The Africa Innovation Mradi is a joint Mozilla Foundation and Mozilla Corporation programme that leverages our role as stewards of the open web to promote innovation grounded in the unique needs of people in African countries.

Mozilla's approach to the Africa programme is to build 'with' and not 'for': working with local partners to foster an ecosystem of allies working toward a healthier internet, while meeting people's needs tailored to local contexts and solving local problems within the following focus areas:

**Strengthening local innovation ecosystems in the Global Majority**
Catalyse new and responsible technology development with African entrepreneurs that furthers the values of openness. Identify and support African innovators, entrepreneurs and developers working on internet health issues. Continue to advocate for policies, laws and regulations that create an enabling environment for a healthy, joyful internet that is open and accessible to all.

**Build products for real life**
Partner with local entrepreneurs, businesses, organisations and governments to adapt Mozilla products to the needs of African communities in order to tailor and improve the value proposition that Mozilla provides to users in the region. In addition, identify and invest in new products and solutions from the region.

**Movement building**
We collaborate with mobilised African communities, by leveraging our resources through partnerships and knowledge-sharing, to highlight and mitigate the harms & silos caused by technology & AI, in order to collectively build a healthier internet ecosystem.
